

**Harris Corporation v. Huawei, et al – Case No. 2:18-cv-439**  
**Plaintiff's Disclosure of Asserted Claims and Infringement Contentions (Pat. L.R. 3-1 & 3-2)**  
**Exhibit C – U.S. Patent No. 6,980,537 ('537) – Claims 1-5, 10-11, 16-19, 24-25, 30-31, 33-34, 36-40, 45-49, 54-68**

Harris Corporation expressly reserves the right to supplement or modify these Disclosures as appropriate upon receipt of further information and discovery. The Huawei '537 Patent Accused Products (as that term is defined and the corresponding devices are identified in Harris's P.R. 3-1 and P.R. 3-2 disclosures cover pleading) infringe at least the following claims. References to instrumentalities in this chart are exemplary only and should not be construed as limiting the scope of any claim of the '537 patent. The Huawei '537 Patent Accused Products satisfy each claim element below literally. The Huawei '537 Patent Accused Products also satisfy claim elements under the Doctrine of Equivalents, including without limitation where specifically identified below, because they include and perform substantially similar functionality.

'537 PATENT CLAIM 1	INFRINGEMENT BY HUAWEI CORPORATION
<p>[c] a storage unit to store network connectivity information relating to said communication unit and corresponding neighboring units; and</p>	<p>The Huawei '537 Patent Accused Products incorporate a storage unit to store network connectivity information relating to the communication unit and corresponding neighboring units. For example, and without limitation:</p> <p>Zigbee and IEEE 802.15.4 standards describe and require each device to include a neighbor table storing network connectivity information relating to that device and its neighbors. For example, and without limitation:</p> <p style="padding-left: 40px;">“Any FFD is able to act as a coordinator and provide synchronization services to other devices or other coordinators. . . . A candidate device receiving a beacon frame is able to request to join the network at the PAN coordinator. If the PAN coordinator permits the device to join, it <i>adds the new device as a child device in its neighbor list</i>. Then the newly joined device <i>adds the PAN coordinator as its parent in its neighbor list</i> and begins transmitting periodic beacons; other candidate devices are able to then join the network at that device. If the original candidate device is not able to join the network at the PAN coordinator, it will search for another parent device. The detailed procedures describing how a PAN is started and how devices join a PAN are found in 5.1.2 and 5.1.3.”</p> <p>IEEE Std 802.15.4-2011, at p. 10.</p> <p style="padding-left: 40px;">“A beacon-enabled PAN is used in networks that either require synchronization or support for low latency devices, such as PC peripherals. If the network does not need synchronization or support for low latency devices, it can elect not to use the beacon for normal transfers. However, the beacon is still required for network discovery. The structure of the frames used for the data transfer is specified in 5.2.”</p> <p>IEEE Std 802.15.4-2011, at p. 13.</p>

***Harris Corporation v. Huawei, et al* – Case No. 2:18-cv-439**

'537 PATENT CLAIM 1	INFRINGEMENT BY HUAWEI CORPORATION
<p><b>[f]</b> a neighbor module to examine said network connectivity information and identify neighboring units of said communication unit that are isolated from communications with remaining neighboring units of said communication unit:</p>	<p>The Huawei '537 Patent Accused Products incorporate configuration modules including neighbor modules that examine said network connectivity information and identify neighboring units of the communication unit that are isolated from communications with remaining neighboring units of the communication unit. For example, and without limitation:</p> <p>Zigbee and IEEE 802.15.4 standards describe and require that devices capable of acting as coordinators (e.g. routing units) monitor communications from neighboring units to examine network connectivity information. Upon receiving communications from neighboring units that have become orphaned, or that wish to join, a device may become a new parent routing unit for that orphaned neighboring unit. For example, and without limitation:</p> <p style="padding-left: 40px;">“An RFD connects to a cluster tree network as a leaf device at the end of a branch because RFDs do not allow other devices to associate. Any FFD is able to act as a coordinator and provide synchronization services to other devices or other coordinators. Only one of these coordinators is the overall PAN coordinator, potentially because it has greater computational resources than any other device in the PAN. The PAN coordinator forms the first cluster by choosing an unused PAN identifier and broadcasting beacon frames to neighboring devices. A contention resolution mechanism is required if two or more FFDs simultaneously attempt to establish themselves as PAN coordinators . . .”</p> <p>IEEE Std 802.15.4-2011, at p. 10.</p> <p style="padding-left: 40px;">“The simplest form of a cluster tree network is a single cluster network, but larger networks are possible by forming a mesh of multiple neighboring clusters. Once predetermined application or network requirements are met, the first PAN coordinator instructs a device to become the PAN coordinator of a new cluster adjacent to the first one. Other devices gradually connect and form a multicluster network structure, such as the one seen in Figure 2. The lines in Figure 2 represent the parent-child relationships of the devices and not the communication flow.”</p>

If the PAN coordinator permits the device to join, it adds the new device as a child device in its neighbor list. Then the newly joined device adds the PAN coordinator as its parent in its neighbor list and begins transmitting periodic beacons; other candidate devices are able to then join the network at that device. If the original candidate device is not able to join the network at the PAN coordinator, it will search for another parent device.”</p> <p>IEEE Std 802.15.4-2011, at p. 10.</p>
<p><b>[b]</b> a routing unit configuration module to</p>	<p>The Huawei '537 Patent Accused Products incorporate routing unit configuration modules to examine network connectivity information within said link storage unit in response to the communication unit being</p>

**Harris Corporation v. Huawei, et al – Case No. 2:18-cv-439**  
**Plaintiff's Disclosure of Asserted Claims and Infringement Contentions (Pat. L.R. 3-1 & 3-2)**  
**Exhibit C – U.S. Patent No. 6,980,537 ('537) – Claims 1-5, 10-11, 16-19, 24-25, 30-31, 33-34, 36-40, 45-49, 54-68**

'537 PATENT CLAIM 10	INFRINGEMENT BY HUAWEI CORPORATION
<p>examine said network connectivity information within said link storage unit in response to said communication unit being designated as said routing unit and to designate said communication unit as a transmission routing unit in response to determining that said communication unit communicates with at least one neighboring routing unit that is isolated from communications with remaining neighboring routing units of said communication unit.</p>	<p>designated as a routing unit and to designate the communication unit as a transmission routing unit in response to determining that the communication unit communicates with at least one neighboring routing unit that is isolated from communications with remaining neighboring routing units of the communication unit. For example, and without limitation:</p> <p>Zigbee and IEEE 802.15.4 standards describe and require that devices capable of acting as PAN coordinators (e.g. transmission routing units) monitor communications from neighboring units to examine network connectivity information. Upon receiving communications from neighboring units that have become orphaned, a device may become a new parent routing unit for that orphaned neighboring unit. For example, and without limitation:</p> <p><i>See claim elements 1[f] and 1[g] above.</i></p>

**Harris Corporation v. Huawei, et al – Case No. 2:18-cv-439**  
**Plaintiff's Disclosure of Asserted Claims and Infringement Contentions (Pat. L.R. 3-1 & 3-2)**  
**Exhibit C – U.S. Patent No. 6,980,537 ('537) – Claims 1-5, 10-11, 16-19, 24-25, 30-31, 33-34, 36-40, 45-49, 54-68**

'537 PATENT CLAIM 11	INFRINGEMENT BY HUAWEI CORPORATION
<p><b>11.</b> The unit of claim 10 wherein said transmission routing unit transmits update messages including network connectivity information, and said routing unit configuration module further includes:</p>	<p>The Huawei '537 Patent Accused Products infringe this claim. The Huawei '537 Patent Accused Products incorporate transmission routing units that transmits update messages including network connectivity information.</p> <p><i>See claim element 4[a] above.</i></p>
<p><b>[a]</b> a message forwarding module to receive an update message from a neighboring transmission routing unit in response to said communication unit being designated as said transmission routing unit and to transmit said received message to neighboring routing units to facilitate synchronization of said link storage unit of each said routing unit.</p>	<p>The Huawei '537 Patent Accused Products incorporate message forwarding modules that receive an update message from a neighboring transmission routing unit in response to the communication unit being designated as s transmission routing unit and transmit the received message to neighboring routing units to facilitate synchronization of the link storage unit of each routing unit. For example, and without limitation:</p> <p>Zigbee and IEEE 802.15.4 standards describe and require that devices continuously update their neighboring units with network connectivity information to facilitate synchronization of that information in each device's stored neighbor tables. For example, and without limitation:</p> <p style="padding-left: 40px;">“Any FFD is able to act as a coordinator and provide <i>synchronization services to other devices or other coordinators</i>. . . . A candidate device receiving a beacon frame is able to request to join the network at the PAN coordinator. If the PAN coordinator permits the device to join, it adds the new device as a child device in its neighbor list. Then the newly joined device adds the PAN coordinator as its parent in its neighbor list and <i>begins transmitting periodic beacons</i>; other candidate devices are able to then join the network at that device. If the original candidate device is not able to join the network at the PAN coordinator, it will search for another parent device. The detailed procedures describing how a PAN is started and how devices join a PAN are found in 5.1.2 and 5.1.3.”</p>

'537 PATENT CLAIM 30	INFRINGEMENT BY HUAWEI CORPORATION
	<p>“The responsibilities of the ZDO include defining the role of the device within the network (e.g., ZigBee coordinator or end device), initiating and/or responding to binding requests and establishing a secure relationship between network devices. The ZDO is also responsible for discovering devices on the network and determining which application services they provide”</p> <p>ZigBee Alliance, ZigBee Specification, Version r06 (June 27, 2005), at 17-18.</p> <p>“The ZigBee network layer (NWK) supports star, tree, and mesh topologies. In a star topology, the network is controlled by one single device called the ZigBee coordinator. The ZigBee coordinator is responsible for initiating and maintaining the devices on the network. All other devices, known as end devices, directly communicate with the ZigBee coordinator. In mesh and tree topologies, the ZigBee coordinator is responsible for starting the network and for choosing certain key network parameters, but the network may be extended through the use of ZigBee routers. In tree networks, routers move data and control messages through the network using a hierarchical routing strategy. Tree networks may employ beacon-oriented communication as described in the IEEE 802.15.4 specification.”</p> <p>ZigBee Alliance, ZigBee Specification, Version r21 (Aug. 5, 2015), at 2.</p> <p>“ZigBee Device Objects are applications which employ network and application support layer primitives to implement ZigBee End Devices, ZigBee Routers, and ZigBee Coordinators”</p> <p>ZigBee Alliance, ZigBee Specification, Version r21 (Aug. 5, 2015), at 185.</p> <p>The Huawei '537 Patent Accused Products also incorporate communication units including configuration modules that determine a status of that communication unit as a routing unit, wherein that status is fixed for routing subsequent network messages and re-evaluated in response to changes in network connectivity. For example, and without limitation:</p>

'537 PATENT CLAIM 54	INFRINGEMENT BY HUAWEI CORPORATION
wherein said configuration module includes:	
<p><b>[f]</b> a neighbor module to examine network connectivity information and identify at least one neighboring unit of said communication unit that is required to utilize said communication unit to communicate with network communication units that are outside the range of and greater than one hop away from that neighboring unit;</p>	<p>The Huawei '537 Patent Accused Products incorporate a communication unit including a neighbor module to examine network connectivity information and identify at least one neighboring unit of the communication unit that is required to utilize said communication unit to communicate with network communication units that are outside the range of and greater than one hop away from that neighboring unit. For example, and without limitation:</p> <p>Zigbee and IEEE 802.15.4 standards describe and require each device to include a neighbor table storing network connectivity information relating to that device and its neighbors. Examination of that table permits the device to identify which neighbors must use the device to communicate with other devices that are more than one hop away. For example, and without limitation:</p> <p style="padding-left: 40px;">“The neighbor table of a device shall contain information on every device within transmission range, up to some implementation-dependent limit.</p> <p style="padding-left: 40px;">The neighbor table is useful in two contexts. First of all, it is used during network discovery or rejoining to store information about routers within RF reception range that may be candidate parents. Second, after the device has joined a network, it is used to <i>store relationship and link-state information about neighboring devices in that network</i>. A table entry shall be updated every time a device receives any frame from the corresponding neighbor.”</p> <p>ZigBee Alliance, ZigBee Specification, Version r21 (Aug. 5, 2015), at 319.</p>

'537 PATENT CLAIM 54	INFRINGEMENT BY HUAWEI CORPORATION
<p>[g] a designation module to designate said communication unit as said relay unit based on said examination and in response to determining that at least one neighboring communication unit is required to utilize said communication unit to communicate with network communication units that are outside the range of and greater than one hop away from said neighboring communication unit, wherein said communication unit designation as said relay unit is fixed for transferring subsequent network messages; and</p>	<p>The Huawei '537 Patent Accused Products incorporate a designation module to designate the communication unit as a relay unit based on the examination and in response to determining that at least one neighboring communication unit is required to utilize said communication unit to communicate with network communication units that are outside the range of and greater than one hop away from the neighboring communication unit. For example, and without limitation:</p> <p>Zigbee and IEEE 802.15.4 standards describe and require each router-capable device to identify which neighbors must use the device to communicate with other devices that are more than one hop away, and to become a parent routing unit (e.g. relay unit) for such devices. For example, and without limitation:</p> <p style="padding-left: 40px;">“The responsibilities of the ZigBee NWK layer shall include mechanisms used to join and leave a network, to apply security to frames and to route frames to their intended destinations. In addition, the discovery and maintenance of routes between devices devolve to the NWK layer. Also <b><i>the discovery of one-hop neighbors and the storing of pertinent neighbor information</i></b> are done at the NWK layer. The NWK layer of a ZigBee coordinator (see ‘Network topology’) is responsible for starting a new network, when appropriate, and assigning addresses to newly associated devices”</p> <p>ZigBee Alliance, ZigBee Specification, Version r06 (June 27, 2005), at 17-18.</p> <p style="padding-left: 40px;">“These addresses are unique within a particular network and are <b><i>given by a parent to its children</i></b>. The ZigBee coordinator determines the maximum number of children any device, within its network, is allowed. Of these children, a maximum of <i>nwkMaxRouters</i> can be router-capable devices. The remaining devices shall be reserved for end devices. Every device has an associated depth that indicates the minimum number of hops a transmitted frame must travel, using only parent-child links, to reach the ZigBee coordinator. The ZigBee coordinator itself has a depth of 0, while its children have a depth of 1. Multi-hop networks have a maximum depth that is greater than 1. The ZigBee coordinator also determines the maximum depth of the network.”</p>
